Participating in IMPETUS through SCI-FI empowers communities with citizen science, fostering sustainable agriculture and environmental and social innovation.

## Summary

The SCI-FI (SClence For Inclusion) project aims to foster environmental preservation and social inclusion by integrating sustainable agricultural practices with community engagement.

Conducted in the Friuli Venezia Giulia region of Italy, the project trains vulnerable citizens and farmers as citizen scientists to collect field data, refining agronomic models and promoting precision agriculture. Key activities include installing weather stations, conducting workshops on climate resilience and sustainable farming, and developing a digital platform for data dissemination. By engaging rural communities in technology development and application, the project seeks to reduce distrust towards European initiatives and elucidate the scientific reasons behind sustainable agricultural technologies. This blend of science, technology, and society applied to the agrifood sector aligns with the Agenda 2030 goals, emphasizing the importance of citizen science.

The ultimate goal is to enhance digital transformation in agriculture while improving the social and psychological well-being of participants, fostering a more inclusive and sustainable community.
