Citizen science is our vehicle to enhance multicultural social cohesion, well-being, and environmental awareness in dense urban environment.

GREEN KYPSELI
COMMUNITY GARDEN

Summary

The Green Kypseli Community Garden is a citizen-led project that directly responds to the current urban circumstances of Athens, concerning climate injustice, while promoting urban greening, social integration, and climate resilience through a circular economy approach.

Constructed from repurposed materials sourced from street markets and renovation sites, this garden will be co-designed and co-built with the community, fostering shared ownership, sustainability, and social inclusion. Residents will participate in seed swaps, propagation workshops, and composting sessions, fostering citizen-led urban greening, environmental stewardship, setting a common ground for mutual and cultural exchange, while ensuring that skills and resources circulate within the community.

More than a green space, the garden will be a hub for education and community engagement, transforming urban waste into a valuable community resource. We aim to prove that small-scale interventions can have long-term environmental, social, and policy impact, while creating a scalable model for sustainable urban regeneration and a space where communities come together to learn, grow, and connect.
