SCI-FI(T) empowers inclusive citizen science, turning marginalized voices into active agents of environmental and social change

Summary

TSCI-FI(T) (Science For Inclusion Two) is an inclusive citizen science initiative that brings together marginalised communities, sustainable agriculture, and digital innovation. Building on the success of a previous pilot, the project engages individuals with disabilities, mental health challenges, and rural farmers in hands-on environmental monitoring, participatory research, and creative science communication.

Through workshops, digital training, and storytelling, participants gain skills in data collection, visualisation, and sustainable farming practices. A key feature is the co-designed sensorial garden - an interactive, multisensory space that transforms environmental data into engaging installations, making science accessible to all. SCI-FI(T) addresses key societal challenges by promoting social integration, digital inclusion, and climate resilience. It fosters long-term engagement through peer mentorship and the creation of open-access tools and resources. By valuing each participant's unique contribution, SCI-FI(T) demonstrates how citizen science can be radically inclusive, empowering underrepresented voices and building stronger, more sustainable communities.
